Instructional Models in eLearning and Blended Learning

A Toolbox for Knowledge-Organization and Design-Support

Hans-Dieter Haller, University of Göttingen in cooperation with Jutta List, Leena Freitag, Tim Scholze, BUPNET-Team and blinc based on the works of Karl-Heinz Flechsig

Part 1:	Rationale and Theoretical Background	1-2
Part 2:	Overview about didactic models	3
Part 3:	Instructional design for Blended Learning arrangements	4
Part 4:	Instructional design models and eLearing/	5-10
	Blended Learning (GKDM and eLearning)	
Part 5:	Block designs for blended learning designers:	11-37
	Design Patterns to evaluate and plan of blended learning course	

Part 1: Rationale and Theoretical Background

Groundwork as well as focus of the following report is the "Goettinger Katalog Didaktischer Modelle" (Goettingen Catalogue of Instructional Models), the arrangement of which was started by Karl-Heinz Flechsig in the middle of the seventies and which has been a fundamental field of research and development for the "Institut für Interkulturelle Didaktik" (Institute for Intercultural Didactic) of the Universitity of Goettingen, meanwhile to be continued at the Pedagogical Seminar at this university. This catalogue is concerned with the collection, compilation and systematization of alternative forms of organized learning and teaching and furthermore the documentation and utilization of these by means of publications, courses and computer programs.

The fundamental approach of the "instructional models" serves as documentation tool as well as instructional planning instrument.

With the help of this approach educationalistst like instructional designers, authors, teachers, trainers are enabled to describe their educational offers in a transferrable way and to plan their courses and learning modules according to a good didactic practice.

The didactic models are especialy usable for the planning of Blended Learning arrangements which are didactic settings using a blend (mix) of sifferent methodologies and learning environemments such as classrooms, web-based learning environments as well as practical learning on the job or in learning projects.

The use of computers in educational systems has been manifold, but it concentrates on the support of learning processes and general aspects of management (like collection of demographic data, text writing, and time schedules). The growing professionalization of didactical planning which hereby is called "instructional design" urges upon the search for potentials of electronic data processing.

If didactic designers, planners or authors want to make use of electronic data processing in a routinized way there must be certain regularities that can be used as a basis for programming the algorithms.

The systematization of instructional processes which already had been done within the "Goettingen Catalogue of Instructional Models" offered such regularities.

Educationalists using blended learning (e.g. instructional designers) must be aware of these processes to plan their learning arranegements accordingly.

2 Examples:

1. If the educationalist decides to organize a **workshop**, the learners cannot be novices of the topics in question; they have to be involved, already during the preparation and planning of the workshop, and they have to make certain preparatory decisions which require a rather profound thematic knowledge and experience. Without this, they cannot play their roles as participants with equal rights.

2. On the other hand, if one decides to prepare and start an **exploration**, the learners may be quit inexperienced with the exploration field, because an exploration usually serves for first contacts with the field and for orientation knowledge about it. With the help of such a systematization of instructional planning it is now possible and meaningful to develop routines for Blended Learning arrangements.

Characteristics of the instructional model-approach

With the term "instructional model" a level of medium range for reconstruction and presentation of instruction and learning was steered for in the context of the "Goettingen Catalogue of Instructional Models"; less concrete than the term "instructional method", and less idealized as it is done with different categorical approaches (which are very popular in Germany). The attribute "didaktisch" was chosen in the German expression, because it lays particular emphasis on both aspects: instruction and learning. The noun "design" was chosen in analogy to other programs that support artistic operations (like CAD, Computer-aided Design).

This toolbox offers you just an easy to use extract of the instruments available in the framework of the GKDM.

This kit can be easily extended. For intance for authors/educationalists intersted especially in the context of learners and educational institutions we can offer a comprehensive tool-box.

Especially for non-fomal informal learning offers we elaborated project description patterns as well as grids for evaluation and planning of projects and offers.

In case of questions, remarks additional requests - don't hesitate to contact us! – www.blinc-eu.org

Part 2: Overview about didactic models

The following list contains the expressions of all 20 models in German and equivalents in English and French:

- 1. Arbeitsunterricht activity method, assignment method enseignement actif, méthode active
- 2. Disputation disputation, debate disputation, débat
- 3. Erkundung exploration, excursion, field-experience approach découverte de l'environnement, étude du milieu, excursion
- 4. Fallmethode **case method** étude de cas
- 5. Famulatur apprenticeship, asssistence apprentissage par assistance, assistance, stage
- 6. Fernunterricht **distance study**, correspondence instruction cours par correspondence, formation à distance
- 7. Frontalunterricht classroom teaching, teacher directed learning, expository teaching, frontal teaching cours magistral, méthode expositive, enseignement frontal
- 8. Individualisierter Programmierter Unterricht **programed instruction**, **personalized instruction** apprentissage individuel programmé
- 9. Individueller Lernplatz individualized learning center, laboratory plan apprentissage à la bibliothèque, travail autonome
- 10. Kleingruppen-Lerngespräch small-group discussion, micro-study circle apprentissage en petit groupe de discussion, discussion en petit groupe
- 11. Lernausstellung educational exhibition, exposition exposition (didactique)
- 12. Lerndialog educational dialogue dialogue (éducatif)
- 13. Lernkabinett clarifying educational environment environnement éducatif élémentaire
- 14. Lernkonferenz educational conference, symposium colloque, congrès, réunion
- 15. Lernnetzwerk educational network réseau d'apprentissage
- 16. Lernprojekt project method méthode de projet, projet d'apprentissage
- 17. Simulation instructional simulation (jeu de) simulation
- 18. Tutorium **peer tutoring, proctor method** enseignement par un pair, méthode monitorale, méthode tutorale, tuteur
- 19. Vorlesung lecture method conférence, discours
- 20. Werkstattseminar educational workshop atelier didactique

The 20 models can be described by their fundamental didactical principals, the sequential phases, the elements of the learning environment and their suitability for particular contents and target groups. This documentation and presentation system was called the "Göttinger Katalog Didaktischer Modelle" (Goettingen Catalogue of Instructional Models).

Part 3: Instructional design for Blended Learning arrangements

The **major design (planning) operations** for Blended Learning designers can be comprised as follows:

- <u>1.</u> <u>Context Analysis</u> (*standard*) (inquiring for information and decisions about the reference system, target groups, resources, demands),
- 2. Course and Programme Design*
 - a. <u>Programme Design</u> (*if applicaple*) (inquiring for information and decisions about concepts and goals of a program to which the planned course design will be part of, descriptions of target group, learning objectives),
 - b. <u>Course Design</u> ((*standard*) for instance by a **list of contents (1)** or by configuration of a knowledge map, analysis of the disciplinary content and collection of competencies), INCLUDING the
 - c. <u>Model Choice</u> (*standard*) (that means deciding for a given situation, which instructional model(s) fits best),
- 3. <u>Block Design</u> (*standard*) (shaping of the learning environment and its elements, of the learning and teaching functions and actions, the sequences and phases, all this depending upon the model that was chosen),

The following overview presents the didactical models under special regard to the e-Learning trainings.

No.	Learning contents	Learning objectives/competencies (Awareness, Reflection, Exercising, Transfer (application) conceptualization, development)	methodologies* and instructional models	Learning materials**	hrs./%

* in the 1st Blended learning designers workshop we will use a table in the following format for course design:

Part4: Instructional design models and eLearing/Blended Learning (GKDM and eLearning)

Didactic (Instructional) Model	Didactic Principles	Reference to eLearning
Definition		
Activity method, assignment method:	autonomous learning, individualized learning, holistic learning; learning in small groups, project seminar	Tasks referring to information in the web. Work individually or in small groups on written objects. Practical works are to be documented visually (video) and accompanied by comments. A possibility for written corrections is lacking. Presentation of results in the net.
Disputation: Learning with the technique of pro and contra whereby the range of divergent opinions on matters of dispute was organized into categories, for and against specific propositions in order to train the power and ability of judgment and reasoning.	dialectic learning; Dispute, Debate, Technique of pro and contra Panel discussion	Chat could be a possibility. Presentations of participants of panel discussion
Exploration, excursion: Learners explore the natural environment or institutions for the observation or data collection, in order to overlook coherences and to arouse new interests or points of view.	learning by experiencing, learning by direct contact/practice, orientated learning, incidental learning excursion, exploration, practical experience, field study;	Preparation by researching in the Internet, e.g. geographical data. Exploration in the Internet which is part of the "real world". Presentation of results of explorations in the net

Case method:	practical learning, problem-solving learning; case study	Preparation by researching in the Internet, e.g. portals containing information on enterprises. Networking on cases. Presentation of case descriptions in the net.
learning using case studies to present learners with a realistic situation and require them to respond as the person who must solve a problem Apprenticeship, assistance:	learning by assisting,	Very limited possibilities:
Practitioners acquire specific knowledge of high quality by assisting an expert with his/her work over a longer period of time.	learning by assisting, learning on a model; assistance, voluntary service;	An accompanying video documentation would be necessary for both parties. Problem of feedback.
Distance study, correspondence instruction:	individual learning, learning with media correspondence courses and studies, tele-college, tele-learning	"Classical model" for some components of eLearning (historical precursor), in particular web-based course offers.
Learners acquire (theoretical) knowledge (facts, terms, models etc.) by reading specially prepared learning /teaching materials as well as by working on meaningful tasks		

Classroom teaching, expository teaching:	teacher-guided learning, learning in learning groups thematic-orientated learning; presenting education, "impetus-giving" education;	This is still the predominant model in formal training institutions. Not very suitable for eLearning.
Programmed instruction, personalized instruction: Learners acquire predefined knowledge and skills by following a programmed learning program in small and individual learning steps.	individualized learning, programmed learning, target-orientated learning; computer-based training (CBT);	Another precursor for certain elements of the eLearning (("Web-based training"). This model offers advantages to serialistic learners because of its clear structure and instructions (meets a need for security and orientation within closely socialized learning groups).
Individualized learning center, laboratory plan: Learners acquire factual or term knowledge with the help of selected and systematically arranged texts and AV-media which stand in relation to previously developed questions.	self-directed learning, learning with media, Interlinkage between cognitive structures of the learners and the knowledge categories/frame; self-learning place, library	Very suitable for eLearning. So far mostly used in informal training, danger of redundancy. Many web portals offer themselves as "junctions" by offering (usually topic-specific) linkages. Prepared information collections are still rather rare, there are mostly unstructured glossaries.
Micro-study circle, small group discussion: Learners acquire predominately knowledge about personal experiences, evaluations, attitudes and desires by sharing information and opinions in a structured discussion.	learning by mutual exchange, learning in structured dialogues group discussion, thematic-centered interactive method	Typical for "chat" and forum, but up to now approaches for structuring are lacking.

(Educational/learning) exhibition: Learners acquire knowledge at open learning spaces by regarding or handling exhibited or commented objects or illustrations in a certain order.	mobile learning, learning with "exhibits"; fair, activity museum;	In the range of museum portals there are already very well elaborated examples. It's not yet recognizable as an element of the authors' tool for eLearning platforms.
(Educational) dialog: Very Sector of the se	dialogue learning, discovery learning, (identification process in a double sense); socratic Dialog, therapeutic dialogue. dialectic dialogue;	An early example (1966) was the program "Eliza" from Joseph Weizenbaum, who simulated a client-centered therapy after Rogers (in its concept a parody which was seriously taken by many of his students). In the Internet follow-up programs are presented in abundance. Automation actually contradicts the approach of human communication.
Clarifying educational environment, interactive man-environment learning system/approach: By acting in a specially equipped and didactically prepared learning environment, learners acquire theoretic and practical knowledge from multiple perspectives.	learning in elementary situations, multi-perspective learning, learning without intended purpose; "Freinet"-pedagogy;	Actually, no examples available.
Educational conference, symposium:	collegial learning, incidental learning; congress, symposium, conference	Corresponds to the programs for project management and video conference.

Educational network:	experience-related learning, mutual learning, activation of dynamic knowledge; experience circle, computer conferencing, video conferencing, Internet;	Examples are forums and news-groups
Learning project: Learners participate in projects of innovative practice, in order to apply newly acquired knowledge and to contribute to the improvement of the practice.	innovative learning, interdisciplinary learning; projects;	The element of the practical activity is also missing here. Programs for project management could coordinate the distributed work packages of the project.
Simulation: Very series of the series of th	playful learning, anticipatory learning; planning game, role play, simulator training;	Planning games were already organized at an early stage with the computer and via the internet. How can dramatic scenes be integrated?
Peer tutoring:	learning by teaching, learning from peers; training-assistance approach;	Many new impulses, since many platforms for vocational training contain the tutorial function as a substantial characteristic.

Learners acquire knowledge and concepts by participating as members of an audience in an oral presentation partially supported by media.		In comparison to lectures in presence learning other dramaturgic means are necessary in eLearning, e.g. close-ups of experiments or projections as well as a shorter time interval seem to be substantial, since the attention of learners is different in an eLearning context. Direct feedback of learners is missing.
Educational workshop: Experienced people acquire predominately up- to-date knowledge which is brought in either by individual participants or produced together and solve at least exemplary problems.	product-orientated learning, collegial learning; workshop, quality circle,	Again arises the problem of illustration and coordination of practical activities. "Chats" are only little suitable for verbal communication because of their reduced forms of expression (better would be a video conference). In this context, it is very helpful to offer common "whiteboards".

Part4: Block designs for blended learning designers: Design Patterns to evaluate and plan of blended learning course

In the following we offer design patterns to reflect and plan your learning offer according to the presented instructional models

Instruments of public relations		
(material or ideal) products		
Learning tasks		
	ts are characterised by making the learners (in small	
<u>groups)</u>		
Gain basic knowledge in advance about		
Actively take a working part and participation		
Contribute, apply, check and if applicable		
	nework of the project - from other disciplines as well,	
Gain and impart new knowledge,		
 Reflect and safeguard learning processe and take the responsibility for the project 		
 and take the responsibility for the project For all 	l s consequences.	
For groups For individuals		
Role of the learners		
Acting responsibly		
colleague cooperating with others		
Roles of the learning aides Contact persons in the practical field, who		
acts responsibly and who involves the		
learners into the project activities.		
Experts, who are called in special cas-		
es, in order to include special knowl-		
edge into the project.		
Project managers, responsible for the work-		
ing organisation, documentation, "monitor-		
ing" and evaluation of the project.		
Phases		

Preparatory phase:	
• If applicable appointment of the project	
management	
 Decision on subject and concept 	
Define requirements/rules for the cer-	
tificate	
Preliminary talks with those interested	
 Information about possibilities and con- 	
ditions of participation	
First contacts with institutions	
 Clarification of legal (insurance etc.) 	
and financial conditions	
List of participants	
If applicable contracts	
Planning phase:	
• Formation of groups/allocation of tasks	
between groups or individuals	
 Group targets or for individuals 	
Work plan	
If applicable gain missing precondi-	
tions/competencies	
Approach to the field	
• Agreement on the cooperation between	
learners, project management and	
practice	
Identification of the product (require-	
ments)	
Interaction phase (realisation):	
Learner/project staff	
 Work on partial projects, 	
geenpeter	
cies,	
Gather information,	
Document, discuss and evaluate the	
project progression,	
Develop products. The products.	
The project management carries out a su-	
pervision with the group/individuals.	
All participate in public relations.	
Evaluation phase:	
Presentation and analyse of products	
(learning exhibition?),	
Discussion about the project progres-	
sion, learning success, effect on the	
practical field,	
Discussion about difficulties that oc-	
curred,	
Discussion about the question if experi-	
ences can be generalised,	
Evaluation and discussion with repre-	
sentatives from the practice and other	
people from the public	
Planning of follow-up activities

Block-Design 18,,Peer tutoring, proctor method"	
Subject:	
Elements of the learning env	vironment
Guide line for <i>learners</i> re- garding concept, programme and organisation	
Meetings of the learners in groups if applicable with tu- tors	
Individual meetings of the learners with tutors	
Guide line for <i>tutors</i> which gives a survey on the field of knowl- edge and recommendations for the consulting meeting	
Meeting of the <i>tutors</i> with re- sponsible lecturers	
Learning tasks	
 Learning tasks for <i>learners</i> Are for individuals or for groups and serve the gaining of knowledge. Learning tasks (!) for tutors serve the didactic preparation and the organisation of the meetings (how to impart knowledge to other learners in a well directed and planned way), and feed-back to lecturers. 	
For all	
For groups	
For individuals	
Role of the learners	
Participants in individual con- sultancy and meetings of tu- tor-groups. Group member, who, together with others,	
identifies learning difficulties and formulates learning needs, which are worked on in meetings with tutors	
Roles of the learning aides	
Teachers and experts regard- ing the fields of knowledge, and who, if the need be, de- signs additional teaching of- fers and supervise tutors.	

Tutors, who supervise	
smaller groups of learners	
individually and/or in group	
meetings and here mainly	
deal with learning difficulties	
and give learning support.	
Supervisor, who possibly ad-	
vise the tutors with their work.	
If applicable, special organ-	
<i>iser</i> (if there are numerous	
participants or technical risks,	
e.g. IT).	
Phases	

	stallation phase (training	
ph	ase of the tutors):	
•	Teachers and later tutors	
	develop the concept for	
	the tutorial, which e.g. is	
	in connexion with a	
	course or programme,	
•	Tutors get an overview	
	about the field of knowl-	
	edge of the respective	
	course or programme,	
•	Teachers and tutors an-	
	ticipate learning difficul-	
	ties of the learners,	
•	The work of the <i>tutors</i> will	
•	be agreed by contract.	
DI		
	anning phase: <i>Itors</i>	
10	Arrange their knowledge	
•	with the objective to im-	
	-	
	part it,	
•	Are prepared to ques-	
	tions and objections,	
•	Anticipate (if the need be	
	again or more detailed)	
	learning difficulties of the	
	learners,	
•	Prepare possible learning	
_	material.	
Int	eraction phase:	
•	Learner and tutors organ-	
	ise meeting,	
•	Tutors realise different	
	learning strategies,	
•	Learners ask questions to	
	the tutors,	
•	Possibly use the given	
	learning material,	
•	Gain knowledge and	
	competencies,	
•	Get feed-back,	
•	Use possibilities of the	
	learning consulting,	
•	Develop and improve	
	learning strategies,	
•	Discuss and work on	
	learning difficulties,	
•	Reflect on their learning	
	process.	

Evaluation phase:	
Learner evaluate their	
own learning success and	
the tutorial,	
If applicable supervisors	
will evaluate the tutors,	
 Tutors evaluate the 	
learners,	
Teachers, tutors and	
learners evaluate the	
course,	
All those involved will get	
a feed-back,	
Perspectives for follow-up	
activities will be devel-	
oped.
